

ABSTRACT

5 The image-capturing system and method relates to the field of optics. One embodiment of the image-capturing system comprises a light-emitting device that emits light on an object; an image-forming device that forms one or more images due to a light that is reflected from the object; and a processor that analyzes motion of the object to control electrical devices, where the light-emitting device and the image-forming device are
10 configured to be portable.
